Name: $\qquad$

1. Determine the number of protons, electrons, and neutrons each of these isotopes possesses: $\mathrm{K}-40$, O-20, and U-234.
2. Complete the following nuclear reactions:
a. ${ }_{36}^{95} \mathrm{Kr} \rightarrow+e^{-}+\bar{v}$
b. $\quad \rightarrow{ }_{58}^{140} \mathrm{Ce}+{ }_{2}^{4} \mathrm{He}$
c. ${ }_{6}^{14} C \quad \rightarrow \quad{ }_{7}^{14} N+$
3. Construct the image on the drawing below via ray tracing.

4. Convert a mass defect of 0.115 g to (a) Joules and (b) MeV .
5. A lithium-6 nucleus has a mass of 6.015121 u . The mass of a single proton is 1.007276 u , and the mass of a single neutron is 1.008665 u . (a) What is the mass defect for lithium and (b) what is the binding energy for lithium?
6. The sun radiates energy at the rate of $3.92 \times 10^{26} \mathrm{~W}$. (a) What is the change in the sun's mass in one second? (b) How much mass does the sun lose in the lifetime of your average earthling (say, 75 years)?
7. A 2.50 kg object moves along a straight line. The net force that acts on the object varies with its displacement as shown on the graph. The object starts from rest at $\boldsymbol{x}=\mathbf{0}$ and a time of $\boldsymbol{t}=\mathbf{0}$. It is displaced a total distance of $\mathbf{2 0 . 0} \mathbf{~ m}$. Find:
(a) The acceleration of the object at $\boldsymbol{x}=$ 5.00 m . (b) The time taken for the object to travel the first ten meters. (c) The amount of work done by the force in displacing the object the 20.0 m . (d) The speed of the object at $\boldsymbol{x}=10.0 \mathrm{~m}$. (e) The speed of the object at $x=20.0 \mathrm{~m}$. (f) The change in momentum as the object moves from 10.0 $\boldsymbol{m}$ to 20.0 m .
